VISIBILITY REPORT

How AI and search see your website

qiko.ai

AI VISIBILITY

SEARCH VISIBILITY

Prepared for **https://qiko.ai**

Scan completed **October 12, 2026**

What this report measures

People no longer only type into a search box. They ask an assistant. This report measures both routes to your website and tells you, in plain terms, where you are being found, where you are being trusted, and what to change first.

AI VISIBILITY

Whether assistants such as ChatGPT, Gemini, Claude and Perplexity mention you, describe you correctly, and recommend you when someone asks a question your business should answer. We test a fixed set of real questions across every engine we measure, then check whether you appear and whether the assistant cites you as its source.

SEARCH VISIBILITY

Whether your pages rank in traditional search for the terms your customers use, and whether the technical health, content and authority behind those pages support those rankings.

HOW TO READ THE SCORES

Both scores run from 0 to 100 and are built from measured signals, not opinion. A score is only useful next to its direction of travel. Where we have too little data to be confident, we say so rather than filling the gap with a number.

Contents

01 **Where you stand** the two scores, and what they mean for you
02 **Actions** your fixes, in priority order
03 **Questions people ask AI** the five question types we test
04 **Trust signals** visibility and reputation, measured separately
05 **AI engines** where you show up and where you are absent
06 **SEO factors** the five factors behind the number
07 **Traffic** traffic that assistants send you
08 **Evidence** evidence, coverage and confidence

Where you stand

These scores come from the selected audit. A dash means that score was not recorded.

THE SHORT VERSION

AI visibility signals were captured, but a strategic interpretation was not available.

AI VISIBILITY	SEARCH VISIBILITY
-	68.4

WHAT IS HOLDING EACH ONE BACK

SEO - 68.4/100

Core SEO foundations are present, but technical gaps are still limiting consistent visibility.

Blockers: Missing canonical URL; No mobile viewport meta; Missing meta description

Missing signals: Missing canonical URL; No mobile viewport meta

AIO

Geographic authority signals are strong enough to support competitive local discovery. Machine-readable answer coverage is supporting stronger generative visibility.

Blockers: No schema or entity clarity signals detected; No AIO-relevant schema detected

Missing signals: No schema or entity clarity signals detected; No AIO-relevant schema detected

Actions

No audit-backed actions were recorded for this report.

Questions people ask AI

The text of each question is not stored by this audit. These are the answer-readiness measures it did record.
